# LAB EXERCISE 9

## Aim: Creating Multiple EC2 Instances with for each in Terraform

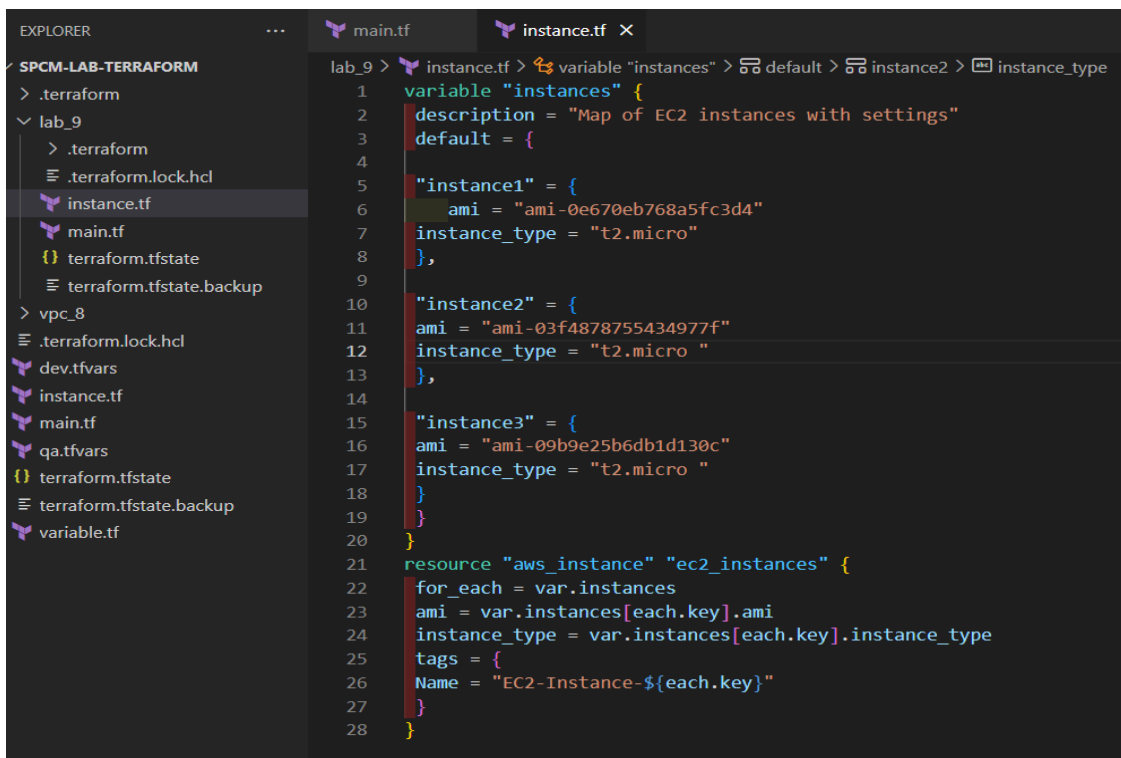

Step 1: Create a main.tf file

The screenshot shows the VS Code interface with the Explorer on the left and the main.tf file open in the editor. The file content is as follows:

```
1 terraform {
2   required_providers {
3     aws = {
4       source = "hashicorp/aws"
5       version = "5.31.0"
6     }
7   }
8 }
9
10 provider "aws" {
11   region = "ap-south-1"
12   access_key = "AKIA54FX20TIW6MD2ETF"
13   secret_key = "W3GFnerAlzg9rwxpSkdKFKun7uqM7G0e7BYt7Rt7"
14 }
```

Step 2: Create a instance.tf file

The screenshot shows the VS Code interface with the Explorer on the left and the instance.tf file open in the editor. The file content is as follows:

```
1 variable "instances" {
2   description = "Map of EC2 instances with settings"
3   default = {
4
5     "instance1" = {
6       ami = "ami-0e670eb768a5fc3d4"
7       instance_type = "t2.micro"
8     },
9
10    "instance2" = {
11      ami = "ami-03f4878755434977f"
12      instance_type = "t2.micro "
13    },
14
15    "instance3" = {
16      ami = "ami-09b9e25b6db1d130c"
17      instance_type = "t2.micro "
18    }
19  }
20 }
21 resource "aws_instance" "ec2_instances" {
22   for_each = var.instances
23   ami = var.instances[each.key].ami
24   instance_type = var.instances[each.key].instance_type
25   tags = {
26     Name = "EC2-Instance-${each.key}"
27   }
28 }
```

Step 3: Now run terraform init command to Initialize.

```
C:\Windows\System32\cmd.exe
Microsoft Windows [Version 10.0.19045.4046]
(c) Microsoft Corporation. All rights reserved.

F:\sem 6\SPCM_LAB\spcm-lab-terraform\lab_9>terraform init

Initializing the backend...

Initializing provider plugins...
- Finding hashicorp/aws versions matching "5.31.0"...
- Installing hashicorp/aws v5.31.0...
- Installed hashicorp/aws v5.31.0 (signed by HashiCorp)

Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.

F:\sem 6\SPCM_LAB\spcm-lab-terraform\lab_9>
```

Step 4: Now run the terraform validate command to check if any error is present or not.

```
F:\sem 6\SPCM_LAB\spcm-lab-terraform\lab_9>terraform validate
Success! The configuration is valid.

F:\sem 6\SPCM_LAB\spcm-lab-terraform\lab_9>
```

Step 5: Now run terraform plan command.

```
F:\sem 6\SPCM_LAB\spcm-lab-terraform\lab_9>terraform plan
```

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:

+ create

Terraform will perform the following actions:

```
# aws_instance.ec2_instances["instance1"] will be created
+ resource "aws_instance" "ec2_instances" {
  + ami                        = "ami-0e670eb768a5fc3d4"
  + arn                      = (known after apply)
  + associate_public_ip_address = (known after apply)

**\*\*\*\*END OF EXPERIMENT-09\*\*\*\***

# LAB EXERCISE 10

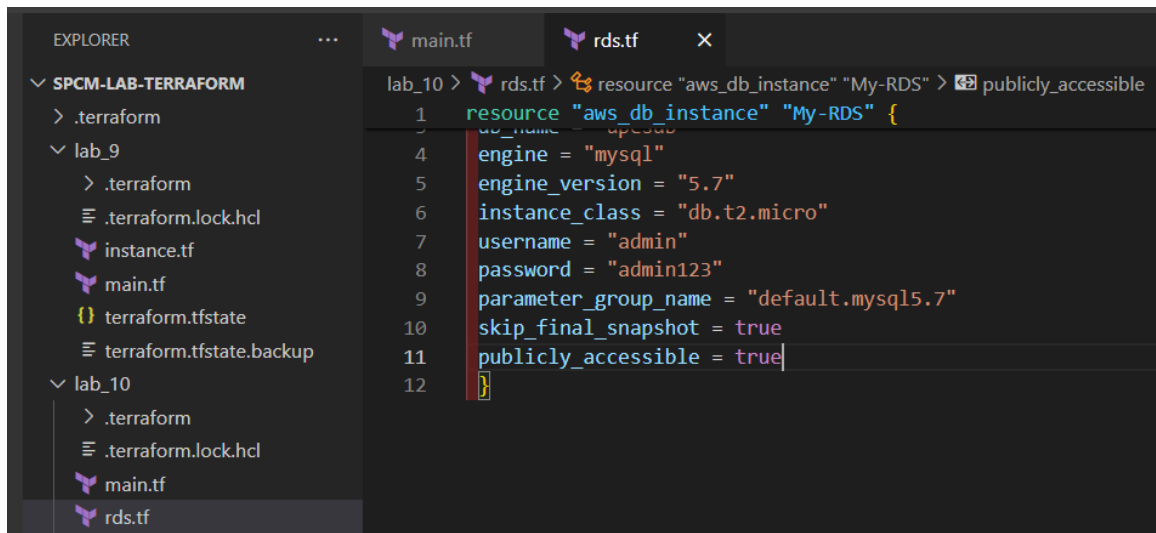

## Aim: Creating an AWS RDS Instance in Terraform

Step 1: Create a main.tf file

A screenshot of a code editor showing the main.tf file. The Explorer on the left shows a project structure with folders for lab\_9 and lab\_10, and files like .terraform, instance.tf, main.tf, terraform.tfstate, and terraform.tfstate.backup. The main.tf file is open, showing the following Terraform configuration:

```
lab_10 > main.tf > provider "aws"
1 terraform {
2   required_providers {
3     aws = {
4       source = "hashicorp/aws"
5       version = "5.31.0"
6     }
7   }
8 }
9
10 provider "aws" {
11   region = "ap-south-1"
12   access_key = "AKIA54FX20TIW6MD2ETF"
13   secret_key = "W3GFnerAlzg9rwxpSkdKFKun7uqM7G0e7BYt7Rt7"
14 }
```

Step 2: Create a rds.tf file

A screenshot of a code editor showing the rds.tf file. The Explorer on the left shows the same project structure as the previous screenshot, but now with an additional rds.tf file in the lab\_10 folder. The rds.tf file is open, showing the following Terraform configuration:

```
lab_10 > rds.tf > resource "aws_db_instance" "My-RDS" > publicly_accessible
1 resource "aws_db_instance" "My-RDS" {
2   db_name = "My-RDS"
3   engine = "mysql"
4   engine_version = "5.7"
5   instance_class = "db.t2.micro"
6   username = "admin"
7   password = "admin123"
8   parameter_group_name = "default.mysql5.7"
9   skip_final_snapshot = true
10  publicly_accessible = true
11 }
12 }
```

Step 3: Now run terraform init command to Initialize.

```

C:\Windows\System32\cmd.exe

Plan: 0 to add, 0 to change, 1 to destroy.

Do you really want to destroy all resources?
  Terraform will destroy all your managed infrastructure, as shown above.
  There is no undo. Only 'yes' will be accepted to confirm.

Enter a value: yes
```
